EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production Environment

---

Project: Insurance Claim Management System

241401114

1. Aim

To deploy the Insurance Claim Management System, built in Zoho Creator, from the Development environment to the Stage environment for testing and then on to the Production environment, so that a verified and approved release of the application goes live for end users.

The system handles insurance claim requests, acknowledgement emails and claim reports, so every change has to be reviewed and tested in a safe environment before live users are affected.

2. Procedure

Step 1: Review the application in Development — The dashboard and reports of the Insurance Claim Management System were checked in the Development environment to confirm that the application was ready for deployment (Section 3.2).

Step 2: Open the Environments page — Deploy > Environments was opened. The application showed the Stage and Production columns along with the label indicating that changes were available to publish (Section 3.3).

Step 3: Select components for Stage — Publish > Publish to Stage was chosen. The modified components of the application were selected and the Development and Staging code was compared side by side (Section 3.4).

Step 4: Enter the publish details — A title, description, version type and email notification address were entered, the version change was confirmed and the application was published (Section 3.5).

Step 5: Confirm the Stage deployment — The “Publish to Stage initiated” message and the completion email from Zoho Creator were checked (Section 3.6).

Step 6: Publish to Production — After testing in Stage, Publish to Production was started and the Environments page was used to track it (Section 3.7).

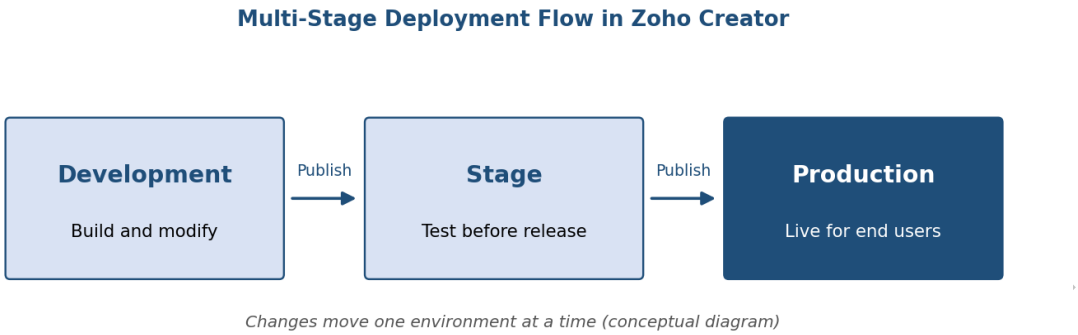

Step 7: Verify the live application — The Production environment, its version, its Live status and the Deployment Progress panel were verified (Section 3.7), and the results were summarised (Sections 3.8 and 3.9).

Note: version numbers, dates and times are shown exactly as they appeared on screen. Menu options and feature names may vary with the Zoho Creator plan and version.

3. Output

3.1 Multi-stage deployment model

Zoho Creator offers three environments: Development, where the application is built and changed; Stage, a test copy for checking it; and Production, the live copy used by end users. A change moves one step at a time, so untested work never reaches live users.

3.2 Application overview (Development dashboard)

Before deployment, the dashboard of the Insurance Claim Management System was reviewed in the Development environment, where it displayed the summary of claim data.

3.3 Environments page

The Environments page lists the application with Stage and Production columns. A label showing that changes were available confirmed Development had updates ready to publish.

3.4 Selecting components and comparing versions

In the Publish to Stage window, the modified components were chosen. The code view shows the Development and Staging versions of each component side by side.

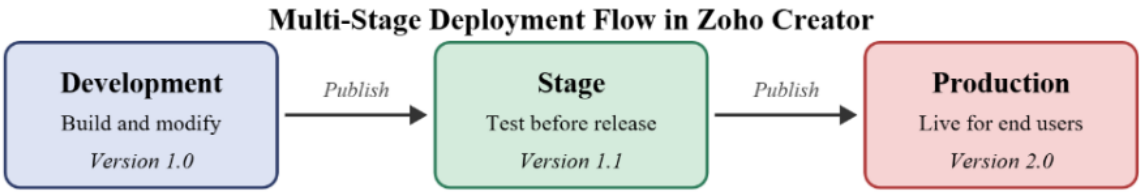

3.5 Publish details

The title, description and version type were filled in, and email notification was turned on. The version change was confirmed. A warning noted that the application stays in maintenance mode, and cannot be accessed, until publishing finishes.

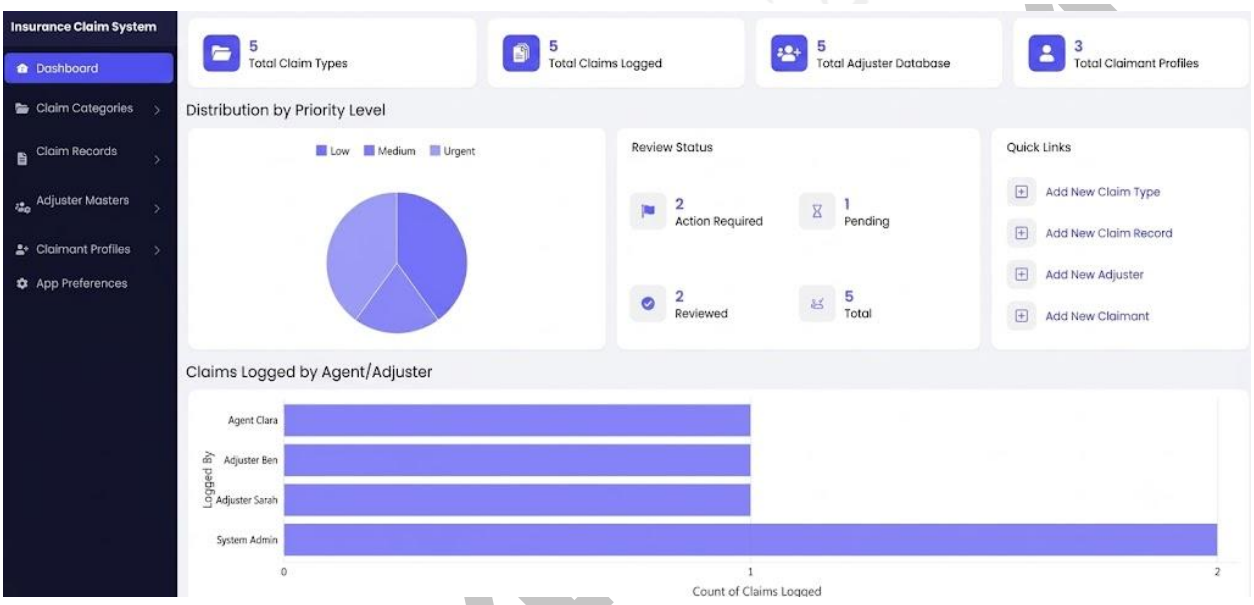

3.6 Stage deployment confirmation

After clicking Publish, Zoho Creator displayed “Publish to Stage initiated” and noted that the process takes a few minutes. A completion email from Zoho Creator confirmed that the version was published successfully.

241401

Changes move one environment at a time; the application is in maintenance mode while publishing.

3.7 Production deployment and live status

After testing, the approved version was published to Production. The Environments page then displayed the Production environment with the status Live.

3.8 Deployment summary

Environment	Version	Date	Status	Description
Development	1.0	Oct 8 2026	Deployed	Application configured and ready for deployment
Stage	1.1	Oct 9 2026	Deployed	Application tested and approved in Stage
Production	2	Oct 9 2026	Live	Application live and accessible to end users

3.9 Deployment practices followed

The deployment followed sound release practice: the modified components were reviewed and the Development and Staging code was compared before publishing; the version was tested in Stage before it went to Production; every release carried a clear title, description and version type; email notification was enabled and received; the maintenance-mode warning was acknowledged; and the Live status and Deployment Progress panel were checked once publishing finished.

4. Final Result

The Insurance Claim Management System was deployed through the multi-stage process of Zoho Creator. The modified components were reviewed and published from Development to Stage, which the Zoho Creator completion email confirmed. After testing, the application was published to Production, where the Environments page shows it as Live.

The exercise achieved its goal of moving a Zoho Creator application from the Development environment to the Production environment through controlled and traceable steps.
