EXPERIMENT 07

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

---

Project: Insurance Claim Management System

24140114

1. Aim

To integrate the Insurance Claim Request Form developed in Zoho Creator with Zoho Calendar by creating an authorized connection and using a Deluge script to call the Zoho Calendar API.

The integration aims to automatically create a calendar event when a new insurance claim is successfully submitted, helping the claims team track claim submissions and schedule follow-up activities without manually entering them into the calendar.

2. Procedure

Step 1: Open Microservices
Open the existing Insurance Claim Management application in edit mode. Navigate to Develop → Microservices and select Create New.

Step 2: Choose Connections
Select Connections from the available microservice options. Connections allow Zoho Creator to securely communicate with other services.

Step 3: Configure the Zoho Calendar connection
Select Zoho Calendar and create a connection named `Insurance_Claim_Calendar`. Choose the permissions needed to create calendar events. The required scope for event creation is typically `ZohoCalendar.event.CREATE` or `ZohoCalendar.event.ALL`, depending on the available connection options.

Step 4: Authorize the connection
Authorize the connection using your Zoho account and grant the requested calendar permissions. Once authorization is complete, verify that the connection is active.

Step 5: Enable the connection for the application
Ensure the authorized connection is available to your Insurance Claim Management application. Note the connection's actual link name, because the Deluge script must use that exact name.

Step 6: Create the workflow
Create a workflow for the existing Insurance Claim Request Form. Set the Record Event to Created and the Form Event to On Submission / Successful Form Submission.

Name the workflow `Create Insurance Claim Calendar Event`.

24140114

Step 7: Write the Deluge script

Add a Deluge script that creates a Zoho Calendar event containing the claim reference, policy number, claimant name, and claim type. The event will serve as a reminder for the claims team to review the new request.

The script must use the actual field link names from your form and the correct calendar identifier. Zoho Calendar provides APIs and Deluge integration options for creating events.

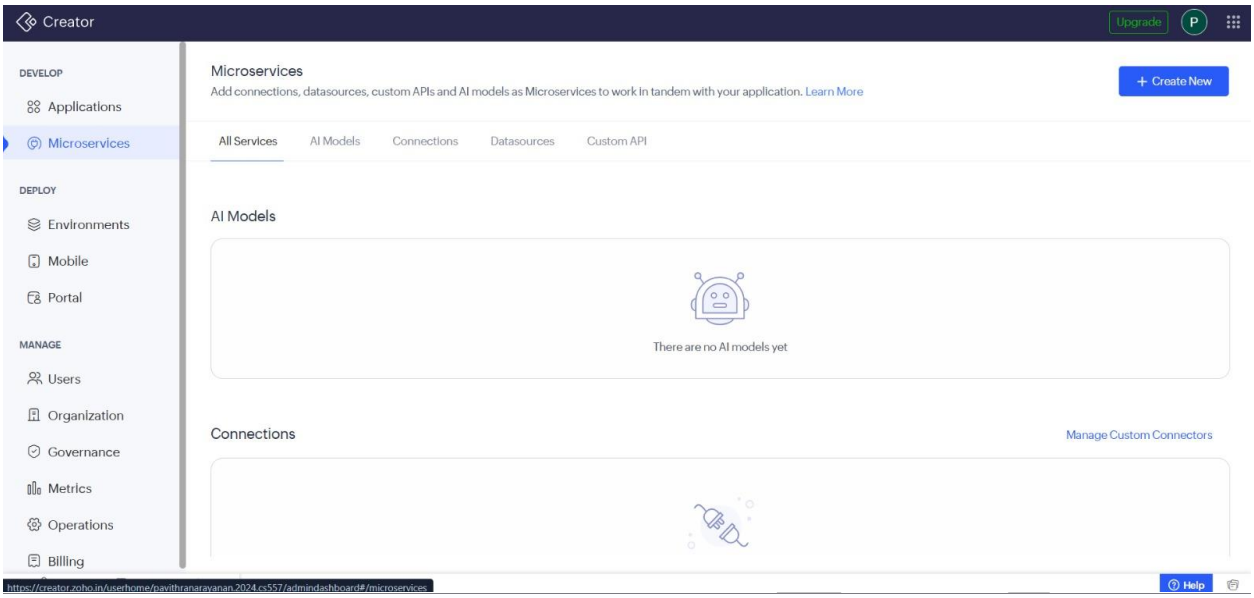

Step 8: Save and test the workflow

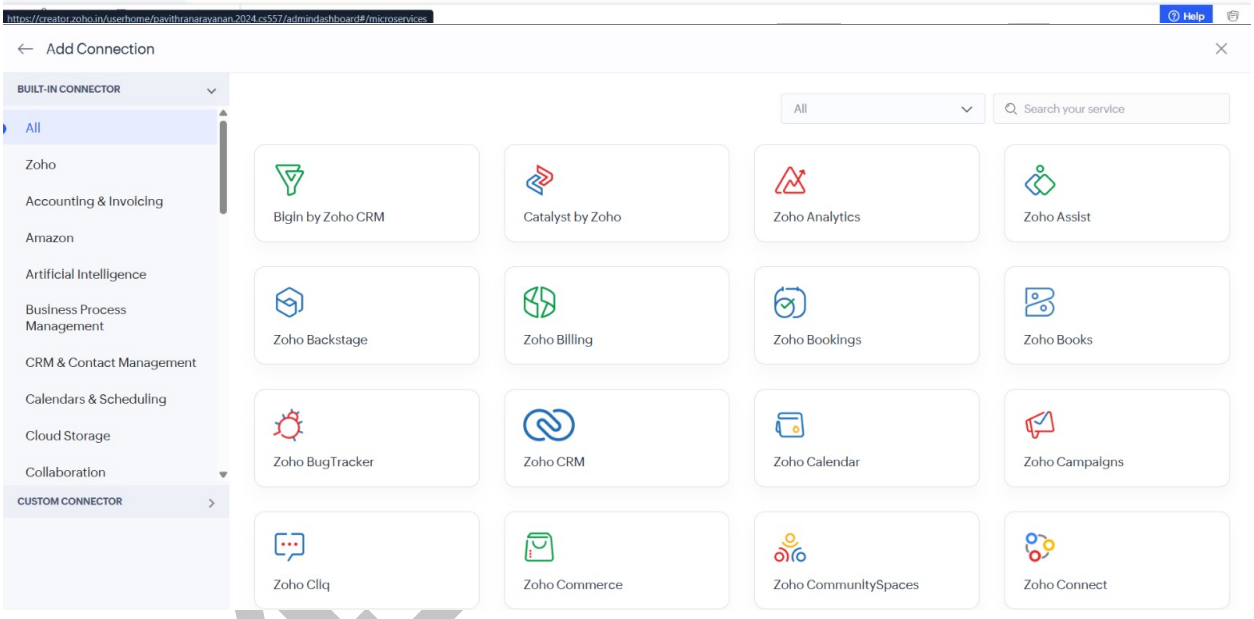

Save the Deluge script and workflow. Submit a test claim through the live form. Open Zoho Calendar and verify that the event was created with the correct details. If an error occurs, check the connection authorization, API response, calendar identifier, and field link names.

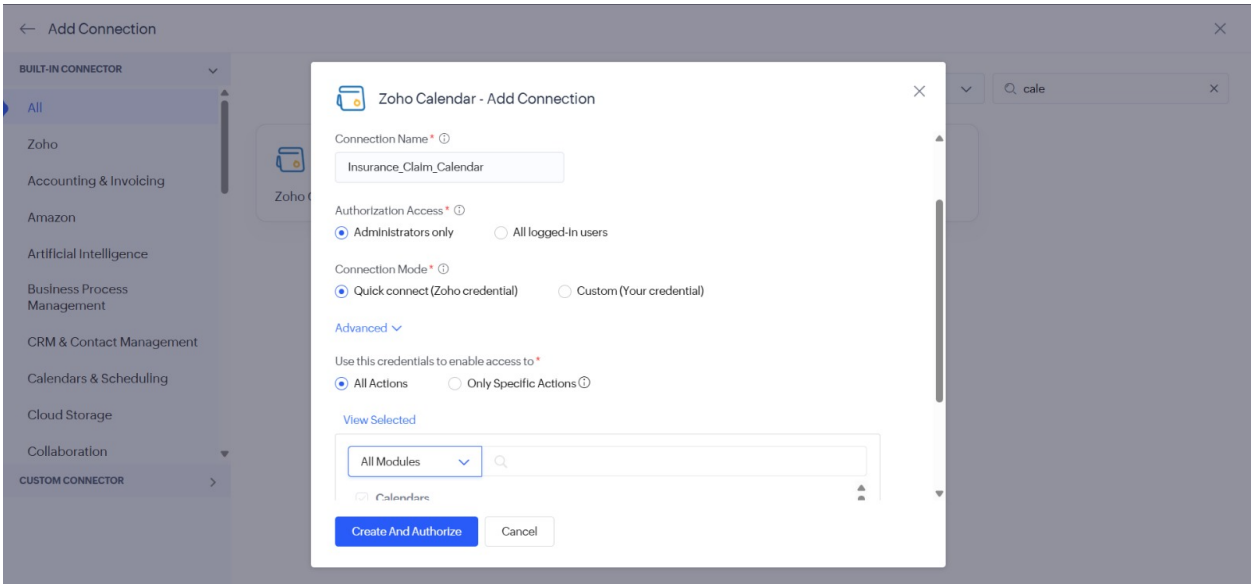

3. Output

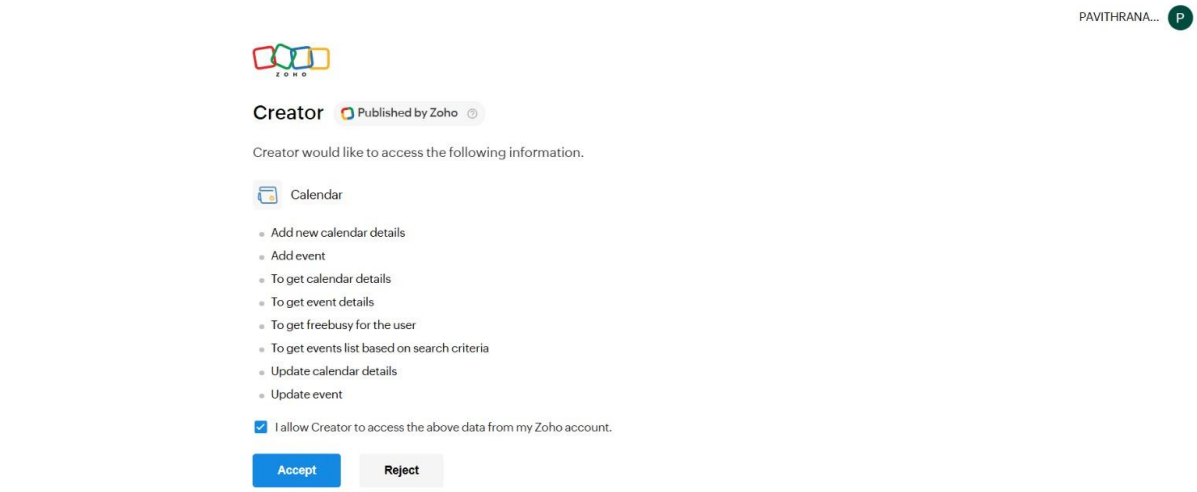

- 3.1: Opening the Microservices section.
- 3.2: Selecting the Connections microservice.
- 3.3: Creating the Zoho Calendar connection.
- 3.4: Authorizing the connection.
- 3.5: Viewing the connection details and link name.
- 3.6: Creating the workflow for the Insurance Claim Request Form.
- 3.7: Writing the Deluge script that creates the calendar event.
- 3.8: Submitting a test claim and verifying the event in Zoho Calendar.

4. Final Result

The Insurance Claim Management application is integrated with Zoho Calendar using an authorized connection and Deluge scripting. When a new insurance claim is successfully submitted, the workflow creates a corresponding calendar event to help the claims team track and schedule claim reviews.

The integration is verified by submitting a test claim and checking the resulting calendar event.
